PROFILE SUMMARY

AI engineer with a backend foundation: Python data pipelines (TensorFlow, Keras) from a 6-month AI/ML internship, a LangChain tool-calling chatbot shipped inside a live product, and a verifiable-inference gateway that gives every AI completion a signed, independently checkable receipt. Comfortable across the applied-AI workflow — data handling, model training and evaluation, and wiring ML/LLM components into production backends (Django/Flask REST APIs).

PROJECTS

ModelReceipt — Verifiable Inference Gateway (hackathon demo) Live [modelreceipt.vercel.app](#) · Code [github](#) · Case study [/modelreceipt](#)

Next.js 15 · TypeScript · Neon Postgres · Cool SDK (cool-nwc) · Python client

- Built for the Northwind Cipher reverse hackathon on the Cool SDK. Every completion returns a receipt naming the model, version and deployment, committed to the prompt and answer without storing either, appended to a live append-only transparency log, verifiable offline with no account.
- The SDK provides the cryptography (salted commitments, ML-DSA/Ed25519 signing, RFC 6962 log, seven-domain verification). I built the system around it: an OpenAI-compatible drop-in proxy with provider routing, the durable Postgres log where a primary key on `leaf_index` makes concurrent writes a detectable conflict, HMAC-keyed subject references so no identifier is stored, an L0–L3 assurance ladder, the verify-and-forge UI, and a Python client.
- Documented limits honestly: receipts from this deployment are mode: `simulated` (no confidential-computing hardware), so the ladder caps at L0 and the model name is a claim, not evidence.

DukaanAI — AI Business Platform for Shop Owners (Founder Project) GitHub [Abrarbyte](#) · Case study [/dukaanai](#)

LangChain · Python · Flask · MySQL · SQLAlchemy · Redis · Flutter · Razorpay

- Built a LangChain-powered Hindi-language chatbot with tool-calling, integrated into a live merchant platform — reads and writes against a Flask + MySQL backend (8 relational tables, 45+ REST endpoints).
- Designed an AI insights layer — dead-stock detection and demand prediction — surfacing business intelligence directly to store owners.
- Independently built the full platform around it: backend (JWT + bcrypt auth, inventory, billing, credit tracking, reporting), Flutter app (16 screens), Razorpay/UPI + WhatsApp automation.

PROFESSIONAL EXPERIENCE

AI/ML Intern, Backend — ABis Infotech Solutions

Remote · 6 Months

- Wrote Python data pipelines with TensorFlow and Keras — ingestion, preprocessing, feature preparation, model training, evaluation, and prediction.
- Built AI projects including Next Word Prediction, Cat & Dog Classification, Mask Detection, Image Captioning, Face Recognition, and Stock Price Prediction.
- Served model-backed features through Django REST Framework APIs in a live production codebase; real-time updates with WebSockets (Django Channels); deployed on Google Cloud Platform.

Software Developer — Aarmarks Media Live [aarmarksmedia.com](#) · Case study [/aitremarkiq](#)

Aug 2026 – Present · TriMarkity suite incl. AITremarkIQ, SocialSnap

- Work across a live multi-app SaaS suite including the AITremarkIQ AI product and SocialSnap's keyword-triggered automation engine; fixed a JWT signature-verification vulnerability and shipped cross-app session revocation to production.
- Sole developer of a live field-sales CRM (Flutter app + Django/DRF + PostgreSQL + Redis) with auto-generated daily reports and performance analytics — aggregating GPS visits, calls, sales and per-visit travel allowance into automated insights; self-hosted behind a Tailscale tunnel.

TECHNICAL SKILLS

AI/ML: TensorFlow, Keras, Scikit-learn, Pandas, NumPy — data preprocessing, feature engineering, model training & evaluation, applied data pipelines

LLM / GenAI: LangChain, tool-calling agents, prompt-driven chatbot design, OpenAI-compatible gateways

Verifiable AI: signed inference receipts, transparency logs (RFC 6962), attestation levels, offline verification — via the Cool SDK

Languages: Python (OOP, data structures), SQL, JavaScript, TypeScript, PHP 8, C, C++, C#

Backend & APIs: Django, Django REST Framework, Flask, FastAPI, Next.js, SQLAlchemy, Pydantic, JWT auth, WebSockets, Celery + Redis

Databases: PostgreSQL (Neon), MySQL, SQLite, MongoDB — schema design, relational modelling, query optimisation

Cloud & Tools: Google Cloud Platform, Vercel, Git/GitHub, Docker, Postman, PyTest, unittest, VS Code

EDUCATION & CERTIFICATIONS

Bachelor of Computer Applications (BCA), 2023 – 2026 (final year) — Vivekanand College, Kolhapur · Prepverse ML Contest — strong overall performance
