

M. ABRAR PATEL

Python Backend Developer | Django · DRF · Flask · PostgreSQL · REST APIs · Auth & sessions

+91 7249361481 | abrarpatel454@gmail.com | abrarbyte-portfolio-web.vercel.app | github.com/Abrarbyte | linkedin.com/in/abrar-patel | India · Anywhere · Available on notice period

PROFILE SUMMARY

Python backend developer at Aarmarks Media, working on a live multi-app SaaS suite — fixed JWT security vulnerabilities, built cross-app session revocation, and sole engineer of a live field-sales CRM (Flutter + Django REST Framework + PostgreSQL + Redis). Previously a 6-month backend internship inside a live production Django codebase (DRF, WebSockets, GCP). Strong in relational data modelling, role-based access control, and REST API design.

PROFESSIONAL EXPERIENCE

Software Developer — Aarmarks Media

Live [aarmarksmedia.com](#) · Case study [/aitremarkiq](#) · [/crm](#)

Aug 2026 – Present · TriMarkity suite: Dashboard, CRM, MarkReach, AITremarkIQ, SocialSnap

- Fixed a critical auth-middleware vulnerability where a fallback decoded JWTs *without signature verification*, allowing forged admin identities; also fixed token-refresh bugs that logged users out on successful refresh.
- Built cross-app session management, shipped to production: server-side token revocation (jti denylist), cross-tab logout via localStorage events, admin logout propagating across all 4 apps, token lifetime cut from 7 days to 1.
- Sole developer of a live field-sales CRM, end to end — Flutter rep app, Django super-admin dashboard, DRF + PostgreSQL backend; 5-level role hierarchy, GPS visit tracking, per-visit travel-allowance calculation from vehicle and fuel use, auto-generated daily reports.
- Hardened the CRM API: 500-leads/day quota via DRF ScopedRateThrottle backed by Redis; 24-hour lockout of user, session and IP after 5 failed logins. Self-hosted on an office server exposed through a Tailscale domain and tunnel.

Backend Developer Intern (AI/ML) — ABis Infotech Solutions

Remote · 6 Months

- Built and extended REST APIs with Django REST Framework inside an existing live production codebase.
- Implemented real-time features with WebSockets (Django Channels); deployed services on Google Cloud Platform (Compute Engine, Cloud Storage).
- Engineered Python data pipelines (TensorFlow/Keras) served through Django endpoints; worked via feature branches, pull requests, and code review.

PROJECTS

DukaanAI — AI Business Platform for Shop Owners (Founder Project)

GitHub [Abrarbyte](#) · Case study [/dukaanai](#)

Python · Flask · MySQL · SQLAlchemy · Redis · Flutter · LangChain · Razorpay

- Built the full backend independently — Flask + MySQL, 8 relational tables, 45+ REST endpoints covering auth, inventory, billing, credit tracking, and reporting; JWT with bcrypt, Redis-backed rate limiting.
- Integrated Razorpay/UPI-QR payments and WhatsApp automation (auto receipts, restock alerts, credit reminders); built the companion Flutter app (16 screens, Android/iOS).
- Added a LangChain Hindi chatbot with tool-calling against the live API, plus an AI insights layer (dead-stock detection, demand prediction).

ModelReceipt — Verifiable Inference Gateway (hackathon demo)

Live [modelreceipt.vercel.app](#) · Code [github](#) · Case study [/modelreceipt](#)

Next.js 15 · TypeScript · Neon Postgres · Cool SDK (cool-nwc) · Python client

- Built for the Northwind Cipher reverse hackathon on the Cool SDK. The SDK provides the cryptography (salted commitments, ML-DSA/Ed25519 signing, RFC 6962 log); I built the system around it.
- OpenAI-compatible drop-in proxy with provider routing by key prefix; durable Postgres transparency log where a primary key on leaf_index turns a concurrent write into a detectable conflict rather than a silent fork.
- HMAC-keyed subject references so no user identifier is ever stored; L0–L3 assurance ladder; verify-and-forge UI with embeddable badges; Python client over HTTP.

EVATE — Menswear Storefront

GitHub [Abrarbyte](#) · Case study [/evate](#)

React 19 · TypeScript · Flask · SQLAlchemy

- Flask app factory with admin/shop/API blueprints; Flask-Login + CSRF (exempted for the JSON API); order items snapshot name and unit price at purchase so history survives price changes.

TECHNICAL SKILLS

Languages: Python (OOP, data structures), SQL, JavaScript, TypeScript, PHP 8, C, C++, C#

Backend & APIs: Django, Django REST Framework, Flask, FastAPI, REST API design, SQLAlchemy ORM, Pydantic, migrations, JWT auth (simplejwt, python-jose), session management

Security: role-based access control, bcrypt, CSRF protection, SQL-injection prevention (prepared statements), token revocation, HMAC-keyed references

Databases: PostgreSQL, MySQL, SQLite, MongoDB — schema design, relational modelling, query optimisation, indexing

Other: WebSockets (Django Channels), Celery + Redis, Razorpay/UPI, LangChain, TensorFlow/Keras, Pandas

Cloud & Tools: Google Cloud Platform, Vercel, Git/GitHub (branching, PRs, code review), Docker, Postman, PyTest, unittest, VS Code

EDUCATION & CERTIFICATIONS

Bachelor of Computer Applications (BCA), 2023 – 2026 (final year) — Vivekanand College, Kolhapur · Preverse ML Contest — strong overall performance
